

Clinical and Safety Evaluation: CASE RxSM

Helping claims professionals
effectively manage drug spending

Targeting inappropriate, unnecessary and ineffective drug therapies through expert clinical analysis

Successfully implementing drug therapy in workers' compensation requires overcoming many unique obstacles. Injured patients are often prescribed risky medications, including opioids, with a high potential for misuse and adverse health effects. Inappropriate medication can significantly increase claim length and cost, while lowering the potential for positive treatment outcomes.

myMatrixx CASE RxSM was carefully designed to mitigate these risks by comprehensively reviewing patient medication usage. Our workers' comp-focused clinical pharmacists help you identify inappropriate use of medications and provide comprehensive, objective and evidence-based assessments to address adverse patient outcomes and reduce treatment cost.

Our experienced clinical team is equipped to perform CASE Rx reviews for any situation

The myMatrixx team of clinical pharmacists:

- Conduct a preliminary review of the claim to identify potential medication errors
- Complete a thorough analysis and create a detailed report of the findings identifying any potentially inappropriate or inefficient use of medications
- Schedule teleconferences with treating providers and drive implementation of the CASE RxSM interventions
- Make specific recommendations for lower cost, yet equally effective alternatives when opportunities exist

CASE Rx features

CASE Rx merges the **best of human and technological intelligence** to provide an end-to-end solution to managing pharmacy benefits for potentially at-risk patients.

CASE Rx clinical team

Our team of licensed and credentialed pharmacists are laser-focused on the field of workers' compensation. We are up to date with state workers' compensation guidelines and leverage that knowledge to strengthen our assessments and recommendations.

myMatrixx pharmacists are available for consultation at any time during the process. They can explain any potential issues with the patient's drug regimen and develop a plan for intervention.

Powered by myMatrixx Clinical Analytics Results Engine (CARE)

An innovative business intelligence program leveraging the power of myMatrixx's extensive library of data.

- Identifies and measures clinical utilization patterns
- Highly effective tool for identifying potentially at-risk patients
- Transforms clinical analytics into actionable intelligence
- Monitors outcomes post intervention

Working together, working for better.
